

AMERICAN HAIRLESS TERRIER

Official UKC Breed Standard

Revised July 26, 2006

Terrier Group

©Copyright 2004, United Kennel Club

The goals and purposes of this breed standard include: to furnish guidelines for breeders who wish to maintain the quality of their breed and to improve it; to advance this breed to a state of similarity throughout the world; and to act as a guide for judges.

Breeders and judges have the responsibility to avoid any conditions or exaggerations that are detrimental to the health, welfare, essence and soundness of this breed, and must take the responsibility to see that these are not perpetuated.

Any departure from the following should be considered a fault, and the seriousness with which the fault should be regarded should be in exact proportion to its degree and its effect upon the health and welfare of the dog and on the dog's ability to perform its traditional work.

HISTORY

The first American Hairless Terrier, a female named Josephine, was born in 1972, part of a litter of purebred coated Rat Terriers. The breeder, Edwin Scott, began to develop the breed from Josephine's descendants. Although he never used any dogs but Rat Terriers in his breeding program, it was always Scott's intention for the hairless dogs to be a separate breed. However, in 1999, when United Kennel Club recognized the Rat Terrier, Scott and his fellow breeders agreed to allow the hairless dogs to enter the UKC registry as Rat Terriers, hairless variety. Upon separation, all of the hairless Rat Terriers and all of their coated descendants, products of careful breeding to the finest coated Rat Terriers, were given the name originally chosen for the breed by Edwin Scott: American Hairless Terrier. While it may seem contradictory to have coated dogs in a hairless breed, it will be necessary for the foreseeable future to continue to include some Rat Terrier crosses until there are sufficient hairless dogs to maintain a separate and healthy gene pool.

The American Hairless Terrier was recognized by the United Kennel Club on January 1, 2004.

GENERAL APPEARANCE

The American Hairless Terrier is a smoothly muscled, active, small-to-medium terrier. The preferred ratio of length of body (prosternum to point of buttocks) to height (withers to ground) to is 10:9. The head is broad, slightly domed, wedge-shaped, and proportionate to the size of the body. Ears are V-shaped, set at the outside edges of the skull, and may be erect, tipped or button. Both varieties may have a natural tail carried in

an upward curve, or the tail may be docked in dogs of the coated variety. The American Hairless Terrier comes in a number of skin colors and patterns (hairless variety) and coat colors and patterns (coated variety).

Disqualifications: A short-legged dog whose proportions vary significantly from the 10:9 ratio lacks breed type and must be disqualified. Unilateral or bilateral cryptorchid.

CHARACTERISTICS

The American Hairless Terrier is an energetic, alert dog whose curiosity and intelligence make him easy to train. The ancestors of this breed were bred to hunt. The lack of coat makes the hairless variety unsuited for hunting, but both varieties still have a strong hunting instinct and the coated dogs are fearless, tenacious hunters with seemingly unlimited energy. The American Hairless Terrier is an exceptionally friendly companion, getting along well with children, other dogs, and even cats. American Hairless Terriers enjoy human companionship immensely and will enthusiastically share any activity with their owners. The hairless dogs require protection from the sun and winter cold weather. American Hairless Terriers should not be sparred during conformation judging.

Disqualifications: Viciousness or extreme shyness.

HEAD

The head is proportionate to the size of the body. When viewed from the side, the skull and muzzle are of equal length and joined by a moderate stop. Viewed from the front and the side, the American Hairless Terrier's head forms a blunt wedge shape.

Fault: Abrupt stop.

SKULL – The skull is broad and slightly domed. It tapers slightly toward the muzzle. The jaws are powerful with well-muscled cheeks.

Serious fault: Apple head.

MUZZLE – The muzzle is well filled-out under the eyes, well-chiseled, and tapers slightly from the stop to the nose. Jaws are powerful and hinged well back allowing the dog to open his mouth wide enough to catch rats and other rodents. Lips are dry and tight with no flews. Lip pigment matches nose pigment.

Fault: Snipey muzzle.

TEETH – The American Hairless Terrier has a complete set of good-sized, evenly spaced, white teeth. A scissors bite is preferred but a level bite is acceptable.

Faults: Missing teeth; overshot or undershot bite.

NOSE – The nose is black or self-colored.

Faults: Dudley or butterfly nose.

EYES – Eyes are set obliquely and are round, moderate in size, and somewhat prominent. Eye rims match nose pigment.

Hairless Variety: Eyes may be any color found in the coated variety.

Coated Variety: Eye color ranges from dark brown to amber and corresponds with coat color. Hazel eyes are acceptable in dogs with lighter coat color. Blue or amber eyes are permitted in blue-colored dogs only, but a dark gray eye with gray eye rims is preferred.

Faults: Bulgy eyes; deep-set eyes; light-colored eyes in a dog with black coat color or black pigment; both eyes not of matching colors; eye with iris containing more than one color; wall or china eye.

EARS – Ears are V-shaped, set at the outside edges of the skull. Erect ears are preferred but tipped or button ears are acceptable. Matching ears are strongly preferred. Non-matching ear carriage should be penalized to the degree of the variation. Note: Ear carriage may not stabilize until a dog is mature. Dogs under one year of age should not be penalized for variations in ear carriage.

Faults: Erect ears with the sides curved inward forming a shape like a tulip petal; rose ears; flying ears; non-matching ear carriages.

Disqualifications: Hanging ears. Unilateral or bilateral deafness.

NECK

The neck is clean, moderately long, smoothly muscled, slightly arched, and tapers slightly from the shoulders to the head. The neck blends smoothly into well laid back shoulders.

FOREQUARTERS

Shoulders are smoothly muscled. The shoulder blades are well laid back with the upper tips fairly close together at the withers. The upper arm appears to be equal in length to the shoulder blade and joins it at an apparent right angle. The elbows are close to the body. Viewed from any angle, the forelegs are straight, strong, and sturdy in bone. The pasterns are strong, short, and nearly vertical.

BODY

A properly proportioned American Hairless Terrier is slightly longer (measured from prosternum to point of buttocks) than tall (measured from the withers to the ground), and length of the front leg (measured from point of elbow to the ground) should approximately equal one-half of the dog's height. Whether the dog is standing or moving, the line of the back is strong and level. The loin is moderately short, slightly arched, and muscular, with moderate tuck-up. The croup is slightly sloping. The ribs extend well back and are well sprung

out from the spine, forming a broad, strong back, then curving down and inward to form a deep body. The brisket extends to or just below the elbow. Viewed from the front, the chest between the forelegs is well filled and of moderate width. Viewed from the side, the forechest extends in a shallow oval shape in front of the forelegs.

HINDQUARTERS

The hindquarters are muscular with the length of the upper and lower thighs being approximately equal. The angulation of the hindquarters is in balance with the angulation of the forequarters. The stifles are well-bent, and the hocks are well let down. When the dog is standing, the short, strong rear pasterns are perpendicular to the ground and, viewed from the rear, parallel to one another.

FEET

The feet are compact and slightly oval in shape. The two middle toes are slightly longer than the other toes. Toes may be well split up but not flat or splayed. Front dewclaws may be removed. Rear dewclaws must be removed.

Faults: Flat feet; splayed feet; rear dewclaws present.

TAIL

The tail is set on at the end of the croup. The natural tail is thick at the base and tapers toward the tip. When the dog is alert, the tail is carried in an upward curve. When relaxed, the tail may be carried straight out behind the dog. The tails of the coated variety dogs may be docked. If so, docking should be between the second and third joint of the tail.

Faults (both Varieties): Bent tail; ring tail.

Disqualification (both Varieties): Natural bobtail.

COAT

Hairless Variety: Puppies are born with a soft, vestigial down that generally covers the body. This “down” gradually diminishes until age 6 to 8 weeks, by which

time the pup should be completely hairless. A mature American Hairless Terrier, Hairless variety, is free from hair except for whiskers and guard hairs on the muzzle, and eyebrows. Short, very fine (vellus) hair may be present on the body of a mature dog. The skin is smooth and warm to the touch. The hairless variety may sweat when overheated or stressed, but this is not to be faulted in the ring.

Coated Variety: The coat is short, dense, and smooth, with a sheen. Whiskers are not removed.

Serious faults (Hairless variety): Vellus hair longer than 1mm on a dog over six months of age.

Disqualifications (both varieties): Wire or broken coat; long coat.

COLOR

Hairless Variety: Any skin color is acceptable. The skin is usually parti-colored with an underlying skin color and freckles or spots of contrasting color. Freckles enlarge with age, and skin color will darken when exposed to the sun.

Coated Variety: The coated American Hairless Terrier may be solid white, bi-color, tri-color, sable or brindle, but must always have some white, which may be of any size and located anywhere on the dog. The white area may be ticked as long as white predominates. The remaining accepted colors are: black, tan (ranging from dark tan to very light tan and from intense dark mahogany red to light red with black nose and eye rims), chocolate (ranging from dark liver to light chocolate with self-colored nose and eye rims), blue and blue fawn (with self-colored nose and eye rims), apricot (ranging from orange to faded yellow with black nose and eye rims), and lemon (ranging from orange to faded yellow with self-colored nose and eye rims).

Faults (Coated variety): Fawn (pale yellowish tan with self-colored nose), cream (pale yellow to off-white), fallow with black mask (very light yellowish tan with black mask), and silver (the extreme dilution of blue).

Disqualifications (Coated variety): Merle; absence of white; any solid color other than white.

Disqualification (both Varieties): Albinism.

HEIGHT AND WEIGHT

The American Hairless Terrier ranges in height from 10 to 18 inches tall.

Faults: Height under or over allowed range; obesity.

GAIT

The American Hairless Terrier moves with a jaunty air that suggests agility, speed, and power. American Hairless Terrier gait is smooth and effortless, with good reach of forequarters without any trace of hackney gait. Rear quarters have strong driving power, with hocks fully extending. Viewed from any position, legs turn neither in nor out, nor do feet cross or interfere with each other. As speed increases, feet tend to converge toward center line of balance.

DISQUALIFICATIONS

(A dog with a Disqualification must not be considered for placement in a conformation event, and must be reported to UKC.)

Unilateral or bilateral cryptorchid.

Viciousness or extreme shyness.

Unilateral or bilateral deafness.

A short-legged dog whose proportions vary significantly from the 10:9 ratio. Hanging ears.

Natural bobtail.

Wire or broken coat.

Long coat.

Albinism.

(Coated variety): Merle; absence of white; any solid color other than white.

Please Note: In UKC Conformation Shows, this breed is shown by variety in this order – Coated, Hairless.

The docking of tails and cropping of ears in America is legal and remains a personal choice. However, as an international registry, the United Kennel Club is aware that the practices of cropping and docking have been forbidden in some countries. In light of these developments, the United Kennel Club feels that no dog in any UKC event, including conformation, shall be penalized for a full tail or natural ears.
