

DEUTSCHER WACHTELHUND

(GERMAN SPANIEL)

Official UKC Breed Standard

Revised July 1, 2009

The goals and purposes of this breed standard include: to furnish guidelines for breeders who wish to maintain the quality of their breed and to improve it; to advance this breed to a state of similarity throughout the world; and to act as a guide for judges.

Breeders and judges have the responsibility to avoid any conditions or exaggerations that are detrimental to the health, welfare, essence and soundness of this breed, and must take the responsibility to see that these are not perpetuated.

Any departure from the following should be considered a fault, and the seriousness with which the fault should be regarded should be in exact proportion to its degree and its effect upon the health and welfare of the dog and on the dog's ability to perform its traditional work.

HISTORY

In the 1880s a group of German hunters decided to recreate the Stober, a versatile breed mentioned as far back in German history as 1719. The Stober was known to have the scent following ability similar to that of a bloodhound. The Germans obtained remnants of that breed found in Bavaria and bred them with other sporting spaniels that had a proven passion for hunting. They produced the Wachtelhund (pronounced Valk-tel-hund and means "quail dog") and the breed was officially recognized in 1903. The German Wachtelhund club is called the Verein für Deutsche Wachtelhund (VDW). In Germany, only gamekeepers and hunters own this breed. They are not sold to the non-hunting public. Several Wachtelhunds were brought to United States in the late 1960s and early 1970s, but were only bred once or twice, producing a total of 17 dogs. Several Canadian guides and hunting outfitters have owned

Wachtelhunds for the past twenty years and used them as flushers, retrievers and to track and hold wounded black bear at bay. In 1994 another pair of Wachtelhunds were brought to the United States. Today there are approximately 100 dogs in the U.S. and Canada.

The Deutscher Wachtelhund was recognized by the United Kennel Club in 1996.

GENERAL APPEARANCE

The Deutscher Wachtelhund is a strong boned, muscular, medium sized gundog with long thick wavy hair. It is solidly-built which allows it to retrieve heavy game such as hares and foxes. The ears are fairly long and should reach to the tip of the nose. The size is approximately 18 to 21 inches. Body length, nose to base of tail is twice the height. It is slightly larger than the Springer Spaniel.

CHARACTERISTICS

The Wachtelhund has a vibrant, affectionate and friendly personality and is a willing worker and excellent companion. The Wachtelhund is easily trained to hunt all types of game and is an obsessive scent follower with bloodhound-like persistence. The Germans bred it to do many hunting tasks including finding game, retrieving and recovering game, and blood trailing wounded deer, red stag (elk), and boar. The Wachtelhund is used to hunt waterfowl and upland game and all fur and cloven hoof game from hare, fox, and wild boar. This versatile breed can follow air scents when game is far away, hunting with a high nose like a Pointer, and can follow ground scents like a hound when game is closer. Unlike a hound, however, a Wachtelhund can be called off a trail and will return to its master. This breed naturally hunts in an arc pattern before the hunter, bringing the game back before the hunter. While aggressive in the hunt, the Wachtelhund is a loyal and great family dog. Wachtelhunds prefer to hunt alone and will hold a wounded boar or bear at bay, if necessary. They do best living in the home.

Serious faults: Water and gun shyness.

HEAD AND SKULL

The head appears strong and free from coarseness, and softly contoured, without sharp angles. As a whole, the parts that make up the head combine to produce the distinctive expression of the breed, that being soft and melting, yet dignified, alert and intelligent.

Serious fault: A prominent stop at the eye junction between muzzle and head.

SKULL - When viewed from either the front or the side, the skull is arched and slightly flattened at the top. When viewed in profile, the brow appears to be not appreciably higher than the backskull without a prominent stop at the eye junction between muzzle and head. When viewed from above, the sides of the skull maintain the approximate planes of the muzzle.

MUZZLE - The length of the muzzle is equal to the length of the skull, but is narrower, as is consistent with a full eye placement. The head is in proportion to the body, and the muzzle is in proportion to the head. The jaws are strong, indicative that the dog is capable of carrying game.

Fault: Loose drooling lips that do not close.

TEETH - A full complement of strong, white teeth which meet in a scissors bite.

Serious Faults: Overshot or undershot bites.

NOSE - The nostrils are wide, large and flexible, indicative of room for the proper development of olfactory nerve to ensure good scenting ability. Color is brown.

EYES - The eyes are essential to the overall characteristics of the head. The full, slightly oval-shaped eyes are of medium size and set well apart. The eyelids are tight. The haws are inconspicuous; may be pigmented or not pigmented. The eye color is brown to hazel.

Serious Fault: Loose eye lids.

EARS - The ears are high and wide, flat and lie close to the head, without outward turns. The ear leather is fine and ranges in length from half way between the eye and nose to the nose. The ears are covered with long, silky, straight or slightly wavy hair. The hair makes the ear appear large than it is.

Faults: Insufficient feathering.

NECK

The neck is graceful and muscular. It arches toward the head and blends cleanly into sloping shoulders. It is moderate in length and is in balance with the length and height of the dog.

Faults: Short, thick, with dewlap.

FOREQUARTERS

The shoulders are sloping, with the blades flat and smoothly fitting. The shoulder blade and upper arm are approximately equal in length and form an angle of about 90 degrees. The forelegs are strong and straight, with bone that is nearly uniform in size from the elbow to the heel. The elbows are set close to the body. The upper arm is set well back and joins the shoulder with sufficient angulation so that the elbow is placed beneath the highest point of the shoulder blade when the dog is in a natural stance. The pasterns are nearly straight,

with some flexibility. From the front view, the legs and feet must be vertical and straight to the ground. From the side view, the pasterns should be slightly angled forward. Bones at the foot and lower leg must have clean joints without protruding bones. Legs should have good feathering from the elbow to the foot.

Faults: Loose shoulders. Elbows turned in or out. Knees knuckled over. Bowed legs. Light bones.

BODY

The compact, well-knit body gives the impression of strength. The neckline blends into the shoulder and backline in a smooth curve. The backline slopes very slightly toward the gently rounded croup. The middle back is short and strong, without swayback. The loin is short, wide and deep with slightly bulging muscles to give strength to the hind legs. The loin is very slightly arched, not enough to significantly affect the topline. The croup is gently rounded, without the tendency to fall away sharply.

The chest is deep and oval in appearance from the front view. From the side view, the brisket reaches below the elbow. The forechest is well developed and muscular. The ribs are well sprung and rounded, extending gradually to mid-body tapering to the back ribs, which are of good depth and extend well back. Stomach is flat and level extending from the end of the rib cage to the pelvic area.

Faults: Insufficient spring of rib. Withers too low. Flat or narrow loin. Exaggerated tuck-up. Fine bone.

Serious Faults: Swayback. Roach back. Loose shoulder muscles.

Very Serious Fault: Short back.

HINDQUARTERS

The angulation of the hindquarters is in balance with that of the forequarters. The hips are relatively broad and well rounded. The muscular upper thigh is broad and well rounded, providing adequate propelling power. The muscular lower thigh is broad and thick, approximately equal in length to the upper thigh. The stifle is strong and well bent. From the back view, the legs are parallel and straight to the ground, not bowed. The hindquarters have long thick feathering.

Faults: Bowed legs. Excessive angulation. Short stifle. Hocks too long. Cowhocks. Weak hocks.

FEET

The feet are proportionate in size to the legs. They are strong and oval shaped. The toes are arched and tight with thick hair between the toes. The pads are round, thick and coarse.

Faults: Feet too large or too small. Splayed feet.

TAIL

The tail is set high on the croup and normally docked to between 1/5th and 1/3rd of its length. While the dog is in motion, the tail is carried horizontally, an extension of the croup, and is in constant motion. When the dog is excited or working game, the tail may be carried higher, and wags rapidly. The tail has good feathering.

Fault: Tail set too low.

COAT

The coat is short and fine on the head, and longer on the body, where it is strong, thick, wavy or curly, with enough undercoat to provide protection. It is well feathered.

Faults: Coat too soft. Thin silky hair. Lack of coat.

COLOR

The Deutscher Wachtelhund may be solid brown and brown schimmel (brown ticked with white or roaned).

Brown Wachtelhunds include shades of orange, blond, red, and dark brown; however, brown is the predominant color.

Brownschimmel Wachtelhunds shades from red to dark brown. The following patterns are acceptable:

Brown with white ticking or roaning; White, with or without ticking with brown patches; small brown and white patches called "leopard".

HEIGHT & WEIGHT

Height, at the withers, for males: 18 7/8 to 21¼ inches.

Height, at the withers, for females: 17¾ to 20½ inches.

Desirable weight: 44 to 66 pounds.

Serious Faults: Any Wachtelhund under 16½ inches.

GAIT

The Deutscher Wachtelhund's gait is characterized by drive and the appearance of power, rather than speed, indicative of the breed's use as a hunter in dense cover and upland terrain. Correct angulation enables the dog to cover the ground effortlessly with extension in the front and rear. The head is carried proudly while in motion. The topline remains much the same whether in motion or standing still. They move in a straight line with width between the front and rear appropriate to build and gait.

ELIMINATING FAULTS

(An Eliminating Fault is a Fault serious enough that it eliminates the dog from obtaining any awards in a conformation event.)

Under 16½ inches.

DISQUALIFICATIONS

(A dog with a Disqualification must not be considered for placement in a conformation event, and must be reported to UKC.)

Unilateral or bilateral cryptorchid.

Viciousness or extreme shyness.

Albinism.

Black hair color.

The docking of tails and cropping of ears in America is legal and remains a personal choice. However, as an international registry, the United Kennel Club is aware that the practices of cropping and docking have been forbidden in some countries. In light of these developments, the United Kennel Club feels that no dog in any UKC event, including conformation, shall be penalized for a full tail or natural ears.
